Subject: First-response SLA breaches: what the data shows

Neha, you asked which agents and which shift breach most. The weekly report by agent and shift is attached (out/report.html and the weekly files). The short answer is that the breaches are not mainly about people. They track one change.

What happened Since 30 June 2025 nobody has been rostered 22:00 to 06:00 IST. Five night agents were on the roster before that date and none after. Of the five, two moved to Day shift and three have no later roster row. Tickets created overnight breached 10.3% of the time before and 79.0% of the time since. Day and morning tickets stayed at about 9% throughout. Overnight chat tickets now breach almost every time.

Why the morning team looks bad The helpdesk credits a breach to the agent who resolves the ticket. Of 2,440 breaches in 18 months, 2,018 are credited to Morning-shift agents, but 1,566 of those tickets were created overnight and were already late when the morning team logged in. Judged only on tickets that arrived during their own shift, no Tier 1 agent is above 10.8%, and 27 of 38 are under 8%. I would not use the raw agent ranking in a conversation with anyone.

What it costs Each breach issues a Rs 350 credit. Credits averaged about Rs 12,300 a month in January to June 2025 and about Rs 65,000 a month since. About a quarter of that rise comes from ticket volume roughly doubling (about 378 to 744 a month); the rest comes from the breach rate rising from 9.3% to 24.9%. This answers the question Arjun raised: credits stepped up in July 2025 and have been roughly flat since August, so both Arjun and Priya are describing the same data from different starting points. Overnight customer satisfaction also fell, from 3.42 to 2.94, while day and morning stayed at about 3.47.

The goal I would set Cut the overnight breach rate from 79% to 15%, which is worth about Rs 1.12 lakh a quarter in credits (range Rs 0.94 to 1.22 lakh depending on whether the rate lands at 25% or 9%). This needs no new hires: it means putting one or two existing agents back on the 22:00 to 06:00 window. Overnight volume is about 500 tickets a quarter, so the cover required is small. The cost is some Day and Morning coverage, which I have not been able to size from this data.

One other item to review I found about 94 orders where a refund ticket and a separate replacement ticket both exist, which the policy forbids. The exposure is roughly Rs 4 to 4.7 lakh over 18 months. Some may be legitimate (for example orders of more than one unit), so treat these as cases to review, not confirmed errors.

What to keep in mind

- The helpdesk records the resolving agent, not who replied first, so agent figures are approximate. Weeks 1 of 2025 and 27 of 2026 are partial.

- I did not investigate why ticket volume doubled, and I did not build the AI text tagging of overnight messages. The numbers above come from straightforward calculation, not from an AI model.
- Sameer's note mentioned about 40 failed IVR transcripts. I found 12 under a defined rule, and they have no effect on the numbers.
